

PRO AFP to Text

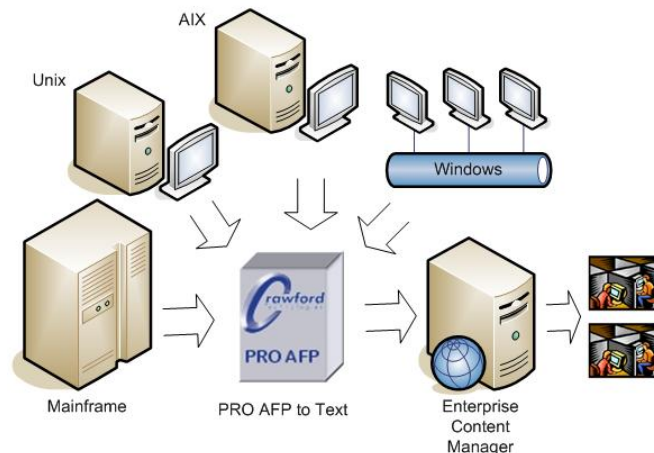

PRO AFP to Text is an ideal tool for customers who want to dynamically convert mission critical documents from Advanced Function Printing (AFPDS) format into text files. CrawfordTech's **PRO AFP to Text** transformation product allows customers to convert their legacy data into a format that can be used with their document composition software as variable data or stored in preexisting data storage applications.

The **PRO AFP to Text** allows clients to dynamically create text files from their AFP documents, which contain all of the text from the original input files. **PRO AFP to Text** makes it very easy for customers to get the text out of their mission critical AFP print streams without incurring any IT modification costs.

What is more, the **PRO AFP to Text** conversion software allows the users to determine whether the text in AFP overlays should be converted or not. It also gives the users the ability to control the output text's character encoding – ASCII or EBCDIC – and how that text should be formatted.

Like all other CrawfordTech's transformation products, **PRO AFP to Text** can run standalone or with any of the following **PRO** options that can provide even more capabilities:

- PRO Indexer
- PRO Splitter
- PRO Document Enhancer
- PRO JES Spool Extraction Facility
- PRO Transform Manager
- PRO JES to FTP
- PRO JES to TCP/IP

PRO AFP to Text is available on all Windows operating systems, as well as under Solaris, AIX, Linux, HP-UX and z/OS. There is also a version that runs under CICS. That allows the customers to use **PRO AFP to Text** when and where it is most convenient.
