

# PRO Image to AFP

**PRO Image to AFP** provides an easy migration path for customers who want to move TIFF images to the AFP architecture without making costly application modifications.

Crawford Technologies Inc. supplies a cost-effective, host-based software tool that interprets TIFF images and transforms them into pages of standard AFP files, which can be printed, viewed or archived using AFP compatible programs.

The support for TIFF input files by the CrawfordTech PRO transform suite enables customers to add images from scanners or archives to transactional data to create powerful new customer or internal use documents such as image statements, manufacturing documentation, invoices and notices.

**PRO Image to AFP** creates images that are perfect representations of the original TIFF files. **PRO Image to AFP** also delivers high-speed performance and stability indispensable in high volume, mission-critical printing environments.

During the conversion, **PRO Image to AFP** can optimize the output files for archiving, retrieval and display using powerful [PRO](#) options. Index entries can be automatically inserted into AFP files thus making it possible to use those files with archival or ECM systems such as Content Management OnDemand or ImagePlus.

**PRO Image to AFP** is available on Linux, Solaris, HP-UX, AIX, z/OS and Windows platforms allowing users to install the software where they need it.
