

PRO Meta to Text

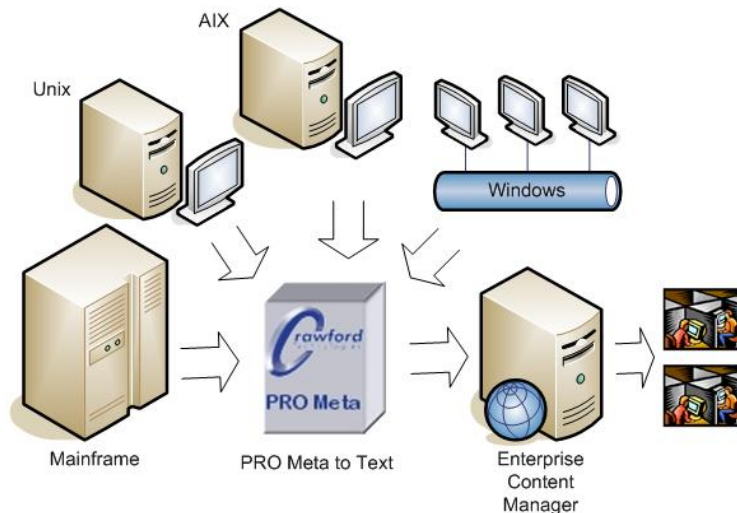

PRO META to Text is an ideal tool for customers who want to dynamically convert their legacy documents from Xerox Metacode and LCDS format into text files. CrawfordTech's **PRO Meta to Text** transformation product allows customers to convert their legacy data into a format that can be used with their document composition software as variable data or stored in preexisting data storage applications.

The **PRO META to Text** allows clients to dynamically create text files from their Xerox Metacode and LCDS documents, which contain all of the text from the original input files. **PRO META to Text** makes it very easy for customers to get the text out of their legacy Xerox print streams without incurring any IT modification costs.

What is more, the **PRO META to Text** conversion software allows the users to determine whether the text in Xerox forms should be converted or not. It also gives the users the ability to control the output text's character encoding – ASCII or EBCDIC – and how that text should be formatted.

Like all other CrawfordTech's transformation products, **PRO META to Text** can run standalone or with any of the following **PRO** options that can provide even more capabilities:

- PRO Indexer
- PRO Splitter
- PRO Document Enhancer
- PRO JES Spool Extraction Facility
- PRO Concatenator
- PRO Transform Manager
- PRO JES to FTP
- PRO JES to TCP/IP

PRO META to Text is available on all Windows operating systems, as well as under Solaris, AIX, Linux, HP-UX and z/OS. That allows the customers to use **PRO META to Text** when and where it is most convenient.
