

PRO PS to Text

PRO PS to Text is an ideal tool for customers who want to dynamically convert their legacy documents from PostScript format into text files.

CrawfordTech's **PRO PS to Text** transformation product allows customers to convert their legacy data into a format that can be used with their document composition software as variable data or stored in preexisting data storage applications.

The **PRO PS to Text** allows clients to dynamically create text files, which contain all of the text from the original PostScript input files. **PRO PS to Text** makes it very easy for customers to get the text out of their PostScript print streams without incurring any IT modification costs.

What is more, the **PRO PS to Text** conversion software allows the users to determine whether the text in PostScript overlays should be converted or not. It also gives the users the ability to control the output text's character encoding - ASCII or EBCDIC - and how that text should be formatted.

Platform Independence

PRO PS to Text is available on Linux, Solaris and Windows platforms allowing users to install the software where they need it.
