

SUNRISE

Add ePresentment capabilities to any enterprise business application

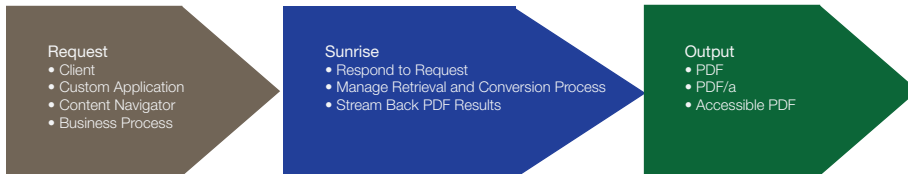

OVERVIEW

SunRise provides users with a single solution for transforming and presenting transactional content stored within ECM repositories.

CrawfordTech SunRise is a solution that works with ECM systems to provide organizations with the ability to retrieve, convert and present information from your repository quickly and accurately. This ECM platform extension is ideal for organizations building ECM business solutions such as bill presentment, claims presentment and any solution with a requirement to retrieve, transform and combine content for viewing.

With an ever expanding amount of document formats being stored in ECM repositories, organizations are constantly facing document compatibility issues. This is more prevalent in the statement and bill presentment arenas where various print formats (AFP, XML, Metacode) are widely used. With CrawfordTech ePresentment, regardless of the document or print format, documents can be presented to the user in PDF format.

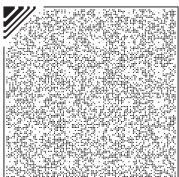

Built with a RESTful web service interface, SunRise receives a request of instructions for retrieval and conversions. The request is processed server side and streams the results back to the requesting application. For example, using a search application, users can locate statements, bills and regulatory documents in any supported ECM system and view the results in a single PDF format.

What does SunRise do?

SunRise enables enterprises to maximize their ECM content retrieval performance automatically and cost effectively. It is designed for high volume throughput in environments with many concurrent users. It offers the following highlights:

- Provides a web service that maximizes the retrieval and transform performance of your existing ECM system.
- Manages multiple connections to ECM systems providing access to all managed content within the enterprise.
- Transform print formats (AFP, Xerox Metacode, PCL and PostScript) to PDF for online applications (requires PRO Transform).
- Cache reusable resources such as fonts, forms, graphical elements and other content to minimize the load on your ECM.
- Makes it easy to access document from ECM repositories from web, cloud and mobile applications using the industry standard RESTful API.

SunRise: How it Works

SunRise works as an intermediary between your ECM system and your business applications that need to retrieve and transform content from your ECM repository. This service provides connection pooling, resource caching, parallel processing, document transformation and other performance maximizing capabilities. As a result, enterprises from all industries are able to achieve maximum performance and throughput from their existing ECM system investment. SunRise automatically performs these performance enhancements for any applications that are integrated with it.

SunRise: Features and Benefits

Features	Benefits
Provides a web service interface that simplifies the retrieval of documents from your existing ECM system.	A single API interface for all supported ECM platforms. No need to learn multiple API's.
Support print formats, image formats and document formats.	No need for the origination application to view documents. View multiple document formats with the free Acrobat Reader.
Server side processing with a RESTful API.	Rapidly and quickly deploy real-time ePresentment solutions. Integrate conversions into any enterprise application.
Connection Pooling, thread management and file locking.	Architected for large scale ePresentment applications.
Combine documents with TOC and page numbering.	Assemble together documents into packets for easier delivery.
Add features such as redaction, barcoding and indexing.	Support a wide scope of business critical applications.

When should you consider SunRise?

- You have a requirement to present transactional content (i.e. bills, invoices, statements, reports) to internal and external users.
- Your company has multiple ECM repositories that contain valuable content for business processes
- You have a large number of users that need to view content stored in your ECM repositories.
- You need to integrate document conversion with your current workflow.

Platforms:

Windows or Linux server

Requirements:

- Application Server
- Data source connection
